

Assumptions and Dependencies

Task 1 - Test Approach

- We have assumed that with the budget and time restraints, it is not realistic to employ a full-time independent test person for our system/integration testing. Therefore, we made the decision to allocate majority of the testing to the test manager alongside the development team.

Task 2 - Test Requirements

-

Task 3 - Scope

- Requirement 5 – the swivel chair interface is being used exclusively for phase 1 of the project, afterwards; software will be developed to process data input
- Requirement 8 – applying for leave on **iOS** devices insinuates that all mobile functionality of the system is iOS exclusive

Task 4 - Test Schedule

- Assumptions of the starting date (beginning of a month)
- Broad assumptions on the time taken for each task, don't have a tangible product to properly estimate testing times
- Assumptions that the legal aspects are not a part of the actual software testing and thus isn't in the plan
- Milestones are arbitrary as other than critical constraints there are no predetermined milestones

Task 5 - Risks

- Note that the implementation of the previous HR system did not go well with only very little input from business stakeholders and low confidence from both HR and Payroll teams, it is to assume that operational risk has the highest chance of occurrence with improper training and communication
